Moscow. Vsesoyuznyy teplotekhnicheskiy institut

Teploobmen pri vysokikh teplovykh nagruzkakh i drugikh spetsial'nykh usloviyakh; sbornik statey (Heat Exchange Under High Thermal Loads and Other Special Conditions; Collection of Articles) Moscow, Gosenergoizdat, 1959. 135 p. 4,000 copies printed.

Ed. (Title page): A. A. Armand; Ed. (Inside book): I. K. Korikovskiy; Tech. Ed.: G. I. Matveyev.

PURPOSE: The book is intended for personnel of scientific research institutes, planning and design organizations, and for power engineers.

COVERAGE: This collection of 9 articles presents the results of research conducted at the All-Union Heat Engineering Institute. Problems of heat exchange under high pressure and other special conditions are analyzed. Attention is devoted to special cases such as heat exchange from wall to water, including cases of ordinary and surface boiling; heat transfer to steam and water under supercritical parameters; heat exchange from pipe wall to gas under high pressure; and the hydraulic resistance of a heated tube. References are given at the end of each article.

Experimental and theoretical study of the absolute intensities of infrared spectra of hydrocarbons in the gaseous phase. Opt. 1 (MIRA 18:10) spektr. 18 no.5:928-930 My 165.

EWT(m)/EPF(c)/EMP(j)/T L 1705-66 ACCESSION NR: AP5012638 UR/0051/65/018/005/0928/0930 535.343 = 15.4AUTHOR: Finkel', A. G.; Tarasova, N. V.; Sverdlov, L. M. 44,55 TITLE: Experimental and theoretical investigation of absolute intensities in the III. 1,3-butadiene 7 40,55 infrared spectra of hydrocarbons in the gas phase. SOURCE: Optika i spektroskopiya, v. 18, no. 5, 1965, 928-930 TOPIC TAGS: IR spectrum, butadiene, deuterium compound, line intensity, conjugated polyolefin hydrocarbon, electrooptic effect, absorption band ABSTRACT: This is a continuation of earlier investigations (Opt. i spektr. v. 15, 195, 1963 ff) of the infrared bands of certain naphthenic and olefinic hydrocarbons. The present work is devoted to a measurement of the absolute intensities of the infrared bands of trans-1,3-butadiene, and to a calculation, on the basis of the experimental data obtained, of a set of electro-optical parameters characterizing the polar properties of the bonds in dienes with conjugated C=C double bonds, in order to determine the effect of conjugation on bond polarity. The absorption spectrum of k,3-butadiene was recorded with an infrared spectrometer using LiF, NaCl, and KBr prisms. The Wilson-Wells extrapolation method (J. Chem. Phys. v. 14, 578, 1946) was used to determine the absolute intensities of the absorption bands. Card 1/2

L 1705-66

ACCESSION NR: AP5012638

experiment is briefly described. A table is presented of the absolute intensities of the infrared bands of trans-1,3-butadiene and C₄D₈. The results show that the C=C double bond to the ends of which different functional groups are attached, is characterized by considerable polarity. The table lists also the calculated intensities of the infrared spectra of trans-1,3-hexadeuterobutadiene, calculated from the electro-optical parameters in this work. The calculation correctly accounts for the intensities of the IR bands at 2335, 2210, 1523, and 718 cm⁻¹ and the medium intensity of the 2270 and 380 cm⁻¹ bands. The intensities calculated for the bands in the 1000--1050 region are apparently too low. Orig. art. has: 1 formula and 1 table.

AUTHOR: Tarasova, N. V.; Leont'yev, A. I.

TITLE: Hydraulic resistance in the flow of a steam-water mixture in a heated by vertical tube

SOURCE: Teplofizika vysokikh temperatur, v. 3, no. 1, 1965, 115-123

TOPIC TAGS: hydraulic resistance, water steam mixture, pressure drop, friction drop

ABSTRACT: In view of the lack of published data applicable in the range of thermal loads prevailing in nuclear reactors, a special experimental investigation was set up to determine the influence of heating on friction resistance of a steam-water mixture. The set-up was an open loop fed with supercritical steam (p = 294 bar, t = 650C). The steam-water mixture was produced in a vertical heated tube by throttling the supercritical steam, which was first cooled to a specific heat content. The experimental tube was 1200 mm long, 550 mm of which was heated electrically. Measurements were made of the pressure and temperature at the inlet to the

Card 1/2

L 45628-65

ACCESSION NR: AP5006474

tube, the pressure drop, the thermal load, and the variation of the tube-wall temperature along its length. The pressure was varied between 49 and 196 bar, the mass velocity betweein 500 and 2000 kg/m 2 sec, and the thermal load between 110,000 and 1.700,000 W/m 2 . The results are represented by various plots and in the form of an empirical formula permitting calculation of the friction pressure loss in the region of low steam content. Orig. art. has: 6 figures, 9 formulas, and 1 table.

ABS TRACT:

Previous parts were reported in papers given by Refs 1-5. The present paper reports calculations of normal vibrations of the butened molecular which is the second member of a homologous series RCHz=CH2. Knowledge of the normal frequencies of butene-1 vibrations is important in thermodynamical calculations. The authors investigated also pentadiene-1,4 and 1,1-dimethylallene in order to find the effect of a second double bond in the carbon chain on the spectra of these molecules. Calculation of normal vibrations followed the method

angles were chosen as vibrational coordinates (Figs 1-3). Force constants

for butene-1 and pentadiene-1,4 were taken from calculations for

Card 1/3

propylene (Ref 2) and propane (Ref 15). Several new force constants

described by Yel'yashevich and Stepanov (Ref 15). Bond lengths and

SOV/51-5-4-2/21

Vibrational Spectra of Unsaturated Hydrocarbons. VI. Calculation and Interpretation of Vibrational Spectra of Butene-1, Pentadiene-1,4 and 1,1-Dimethylallene

were determined using a variational method. In the case of 1,1-dimethylallene the authors used force constants of allene (Ref 5) and isobutylene (Ref 1). Tables 1-3 give the vibrational spectra of butene-1, pentadiene-1,4 and 1,1-dimethylallene respectively. The third column in each table gives the calculated frequencies. The fourth and later columns give the observed experimental values. Table 4 gives the interpretation of the fundamentals and harmonics for butene-1. Tables 1-3 show that good agreement was obtained between the calculated and experimentally observed frequencies. Using the results obtained in this paper the authors interpreted Raman spectra of molecules of the RCH==CH2 (from pentene-1 to undecene-1) and diallyl (Tables 5, 6). More precise values of the characteristic frequencies of RCH==CH2 molecules were obtained and the characteristic frequencies of diolefines and dialkyl-derivatives of allene were

TITLE:

Theory of the Vibration Spectra of Unsaturated Compounds

(Teoriya kolebatel'nykh spektrov nepredel'nykh soyedineniy)

PERIODICAL:

Izvestiya Akademii nauk SSSR. Seriya fizioneskaya, 1958,

Vol 22, Nr 9, pp 1023 - 1025 (USSR)

AESTRACT:

On the basis of abundant experimental information on unsaturated compounds the authors tried to generalize the conclusions drawn from it in two directions.

The determination of the characteristic frequencies of some structural groups with a double bond and the observation of the mutual influence of the structural elements. To solve these problems, normal oscillations and the constants of the potential energy were computed

by means of the theory of the small vibrations of polyatomic molecules (Refs 1-2). Partial results of these computations have been published already before

Card 1/4

(Ref 3). The basic results of the present paper can be condensed

Theory of the Vibration Spectra of Unsaturated Compounds ECV/48-22-3-3/40

的。 第一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,他们

> as follows: The substitution of the hydrogen atoms by alkyl radicals in ethylene leaves the field of the remaining ethylene groups as well as the field of the alkyl redicals almost unchanged. The geometrical distribution of the alkyl radicals with respect to the double bond plays an essential role with regard to the spectrum. The calculations show that in the case of two double bonds that are separated by at least two single bonds the former ones exert almost no influence on each other. On the basis of the computation of the oscillation frequency of cyclopentene the spectrum of the molecule combination dispersion was for the first time interpreted with success. The frequencies and the force constants of some bromine-, chlorine, - and fluorine-substituents of ethylene were computed theoretically. Because of comprehensive data on the spectra of the deutero-substituted melecules it was possible to carry out an exact computation of the force constants. The good agreement between the computed and the observed frequencies proves the correctness of the whole system of constants. Compared with the halogen

Card 2/4

DECEMBER THE BEAUTION OF THE PROPERTY OF THE P

Theory of the Vibration Spectra of Unsaturated Compounds 307/48-22-9-3/45

substituents of saturated hydrocarbons the stability of the C-Br-, C-Cl-, and C-F-bonds in unsaturated compounds is somewhat higher. For the first time

was computed in the first approximation of the optical valence scheme. On this occasion $\mu_{\mbox{\footnotesize{CH}}}$ and $\mu_{\mbox{\footnotesize{CH}}}^{\mbox{\footnotesize{I}}}$

had, as expected, the same values for the oscillations of all types of symmetry. Thus the calculation has shown that the optical valence scheme only in first approximation is applicable to the computation of the intensities in infrared spectra. There are 4 references, 3 of which are Soviet.

TITLE: Reactions of carboxylic acid chlorides with salts of diethylthiophosphorous and phosphinous acids

SOURCE: Zhurnal obshchey khimii, v. 34, no. 12, 1964, 3946-3949

TOPIC TAGS: organic phosphorus compound, ester, phosphinic acid, phosphoric acid, carboxylic acid, chloride

Abstract: The reaction of acetyl chloride with sodium diethylthiophosphile results in the production of the diethyl ester of acetothiophosphinic acid; and diethyl-alpha-(diethylthiophosphone)ethylthiophosphate. The reactions with propionyl chloride proceed analogously. When sodium diethylthiophosphite is added to excess acetyl chloride, in addition to the diethylester of acetothiophosphinic acid, a certain amount of methyldi-(diethylthiophosphane)carbinol acetate is formed. The latter compound was also synthesized by the reaction of acetyl chloride with methyldi-(diethylthiophosphone)carbinol produced in the reaction of acetothiophosphinic ester with diethylthiophosphinic acid in the presence of trichtylamine.

L 238L6-65 ACCESSION NR: AT4045671 v, W and Zr were tested. Specimens consisted of 300 g ingots having a diameter of 18 mm. An argon induction furnace was used and a magnesite crucible. Ingots with a low content of additives were cold-rolled into 5.3 mm rods and cold-roll specimens with a high content of the second component were subjected to intermediate quenching from 1200C. The rods were annealed for two hours at 1000C and the thermoelectromotive force measured within a temperature range of 0 to 1200C. Most tested elements enhanced the thermoelectromotive force of Ni and 15 to 17% Mo, 6.5% Co and 19 to 20% W had a conspicuous effect. Elevated temperature accelerated the effect and low temperature slowed it down considersbly. The only exceptions were Al, Be and Cu: these elements lowered the thermoelectromotive force. Many systems displayed an extremum in solid solutions with Cr, Co, Al, Si, Co, etc. Orig. art. has: 36 figures and 3 tables ASSOCIATION: Gosudarstvennyy nauchno-issledovatel'skiy i proyektnyy institut obrabotki tavetnykh metallov, Moscow (State Scientific Research Planning Institute for the Processing of Nonferrous Netals)

L 32262-65 ACCESSION NR: AT4045672 5% Ge, 40% Mn, 5% Nb, 10% Ni, 20% Re, 5% Si, 10% Ta, 6% Ti, 15% Va. 13% W. 10% Mo and 2% Zr. Testing temperatures varied between 100 and 1200 C. The charges in the thermoelectromotive force were found to become increasingly complex as the concentration of the dissolved component was increased and that accurate observations required the measurement of the thermoelectric properties in a state of equilibrium. With heightened concentration of the solid solution, the thermoelectromotive force was observed to decline. In Co alloys having low solubility components such as Cu, Zr and Be, the increased concentration of the alloying element brought about an initial decrease and subsequently a slight increase of the thermoelectromotive force. Only Co-Cr alloys containing over 20% Cr were found suitable for the positive electrode. These alloys possess a satisfactory thermoelectromotive force and earlier investigations show them to be sufficiently oxidation-resistant. TITLE: Investigation of Alumel and Chromel alloys with cobalt additions

SOURCE: Moscow. Gosudarstvenny*y nauchno-issledovatel'skiy i proyektny*y institut splavov i obrabotki tsvetny*kh metallov. Trudy*, no. 22, 1964. Issledovaniye splavov dlya termopar (Studying alloys for thermocouples), 101-114 TOPIC TAGS: Chromel, Alumel, Co, Mn, Ni, Cr, oxidation resistance, thermal emf ABSTRACT: The decline of the production of Chromel and Alumel couples in recent years initiated an investigation of the thermoelectromotive properties of these alloys with Co additions. The stability, oxidation rate and changes in the thermoelectromotive force under the effect of oxidation were observed in Ni(N-1) Cr(KhO), Si(Krl), Al(A00) and Mn(Mrl) alloy wire rods having a diameter of 3.2 and 1.2 mm. Co additions were found to lower the thermoelectromotive force of Chromel and Alumel, their thermoelectric properties becoming more linear and appproximating the norms set by State Standards (GOST) 1790-63. (see figs. 1 &

Card 1/87

L 23848-65 ACCESSION NR: AT4045673 2 of enclosure). Therefore, Co is a suitable regulator of the thermoelectric properties of both alloys. Oxidation resistance of Chromel and its working properties were substantially improved and those of Alumel to a lesser extent by Co additions. All specimens were endowed with improved stability and the thermoelectromotive force of couples approximated the norms set by State Standards 3044-61. TITLE: Investigation of the effect of the composition of an "CA" alloy on the thermoelectromotive force

SOURCE: Moscow. Gosudarstvenny*y nauchno-issledovatel'skiy i proyektny*y institut splavov i obrabotki tsvetny*kh metallov. Trudy*, no. 22, 1964. Issledovaniye splavov dlya termopar (Studying alloys for thermocouples), 129-142

TOPIC TAGS: aluminum, silicon, manganese, thermoelectromotive force

ABSTRACT: The effect of Si, Al and Mn on the thermoelectromotive force of the Alumel-type alloy "CA" was investigated. Unlike Alumel, the Al contents in the "CA" alloy is higher (up to 3.5%) and the Mn contents lower (less than 2%). All tests were conducted within a 100 to 1000C temperature range. All three components lowered the thermoelectromotive force of the tested alloy. The effect of nents lowered to be independent of the concentration of the two other components.

Card 1/2

L 23849-65 ACCESSION NR: AT4045675

An efficient adjustment of the electromotive force calls for the maintenance of an invariable Mn level of 1.4% during the melting of the alloy while Al and Si are added. The electromotive force rose sharply above 12 mv when Mn quantities were higher and the Si and Al contents was 1.1% and 3.3% respectively. As a were higher and the Si and Al contents was 1.1% and increasing concentrations low-rule, the Al contents in that alloy exceeds 2.8% and increasing concentrations lower the thermoelectromotive force. The lowering effect of Si is more appreciable within the 400 to 1000C range when the alloy has a high Al content. The effect of the composition on the thermoelectromotive force may serve as a basis for the production process of "CA" alloys. Orig. art. has: 12 figures and 2 tables
